# Strength of eviction protections and population mental health during the COVID-19 pandemic

Kathryn M. Leifheit, PhD MSPH

May 5, 2021

# Evictions and mental health

- Housing insecurity is a well-established determinant of mental distress.
- Emerging evidence suggests that evictions and the threat of evictions may be a particularly harmful form of housing insecurity.
- During the COVID-19 pandemic, inability to pay rent was a strong predictor of suicidal ideation

# COVID-19 State Eviction Moratoriums

- Instituted in 43 states + DC
- Effective in preventing the spread of COVID-19  
An estimated 830,000 cases and 39,000 deaths prevented just from June 1<sup>st</sup> – September 3<sup>rd</sup>, 2020
- Protections highly variable by state

# Research questions

Did COVID-19 eviction moratoriums have spillover effects on renters' mental distress?

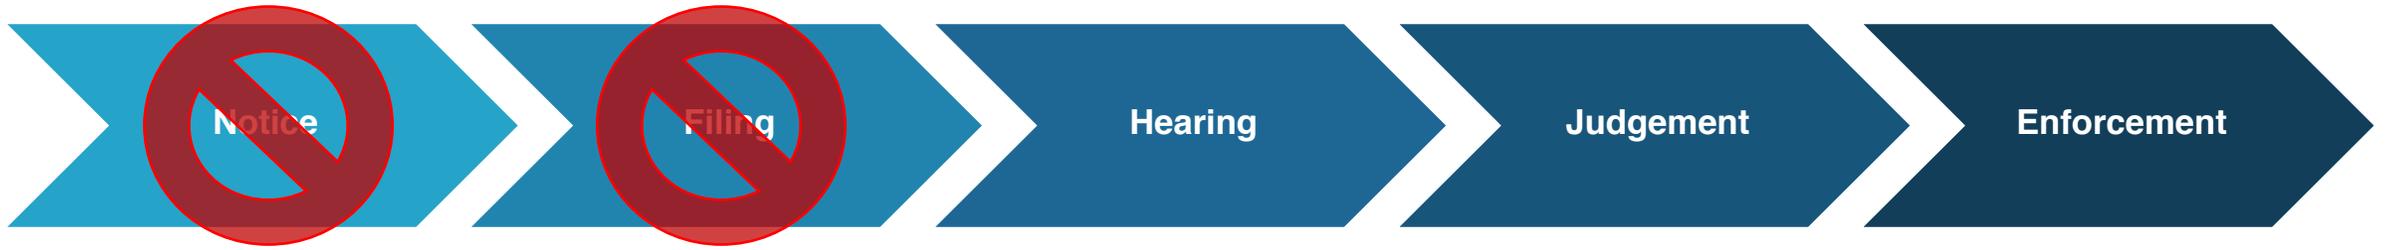

What kinds of protections were the most consequential?

(allows us to learn how the eviction process affects mental distress)

# Stages of the Eviction Process

# Moratorium Protections

## Strong

Prevent displacement,  
Lessen tenant harassment,  
Prevent legal ramifications  
(25 states)

# Moratorium Protections

## Strong

Prevent displacement,  
Lessen tenant harassment,  
Prevent legal ramifications  
(25 states)

## Weak

Prevent displacement  
(18 states)

# Moratorium Protections

Moratoriums also varied with respect to scope

e.g. whether the moratorium was restricted to COVID-19-related hardship

# Study Design

**Source population:** Understanding America Study

- Nationally representative online panel
- COVID data collection March 10, 2020 - present

## **Inclusion criteria**

- Renters
- Baseline household income < \$75,000
- Surveys completed prior to 9/4 CDC moratorium

# Study Design

Outcome: Moderate or severe mental distress in the past 2 weeks

- 4-item Patient Health Questionnaire (PHQ4) score of 6 or higher

Exposure: Time-varying moratorium protection (lagged by 2 weeks)

- Strong, weak, or none

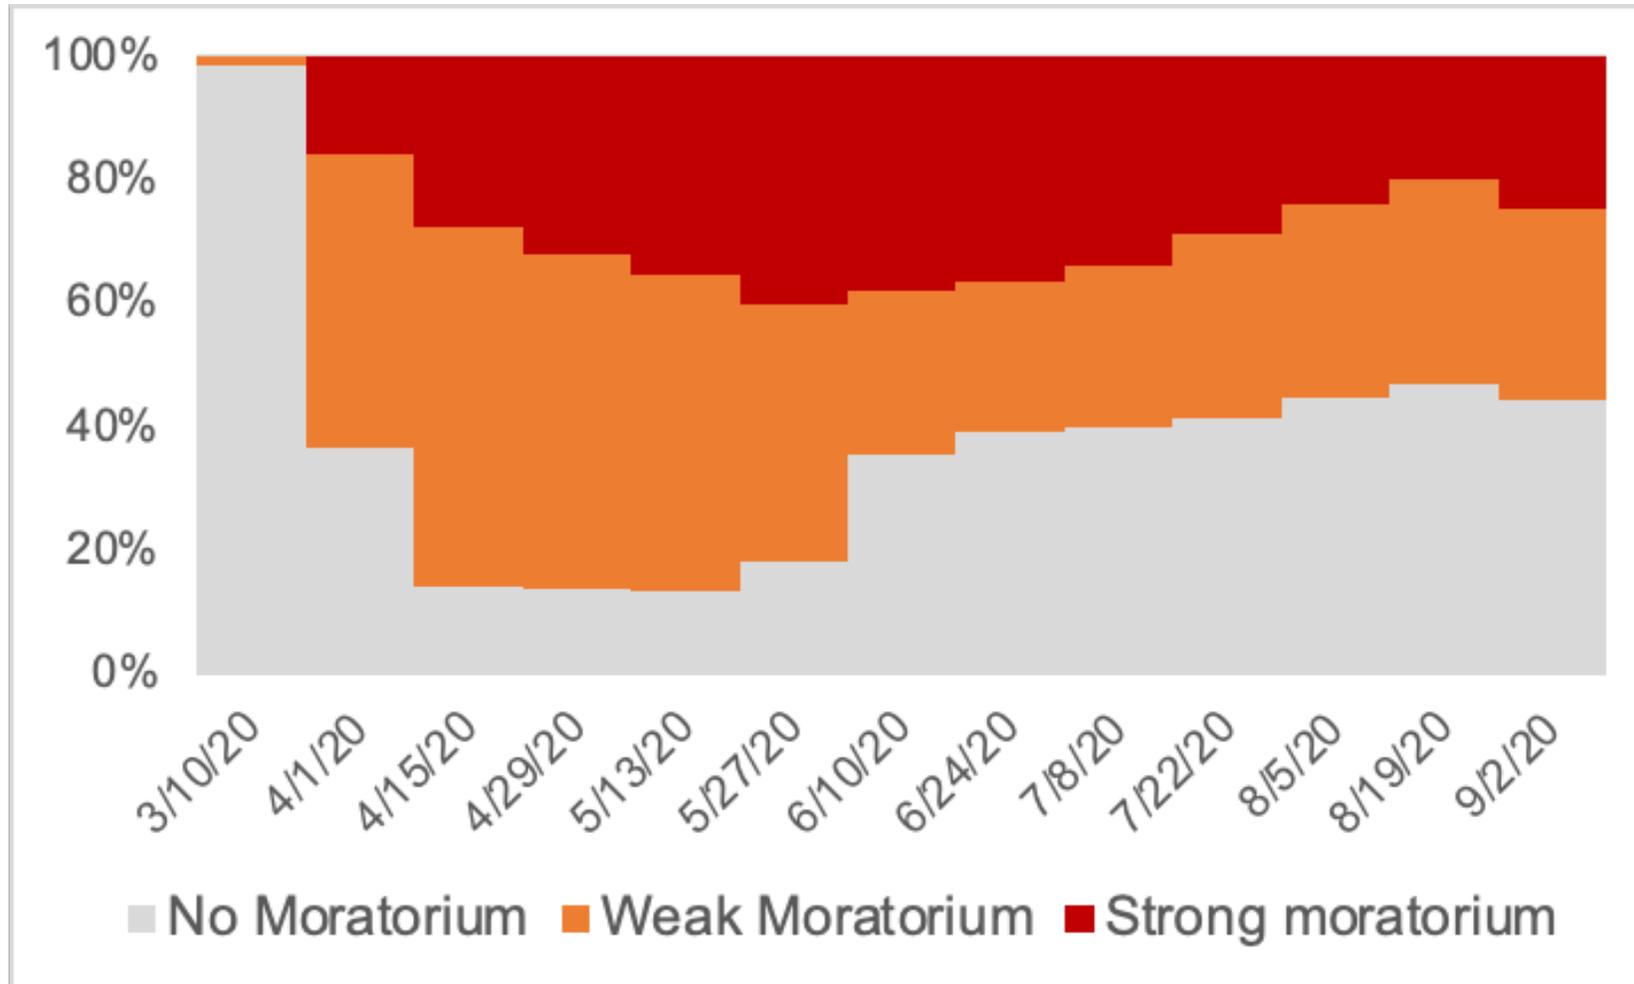

State-level controls (lagged by 2 weeks)

- COVID-19 incidence, COVID-19 mortality, unemployment rate, shelter-in-place orders, school closures

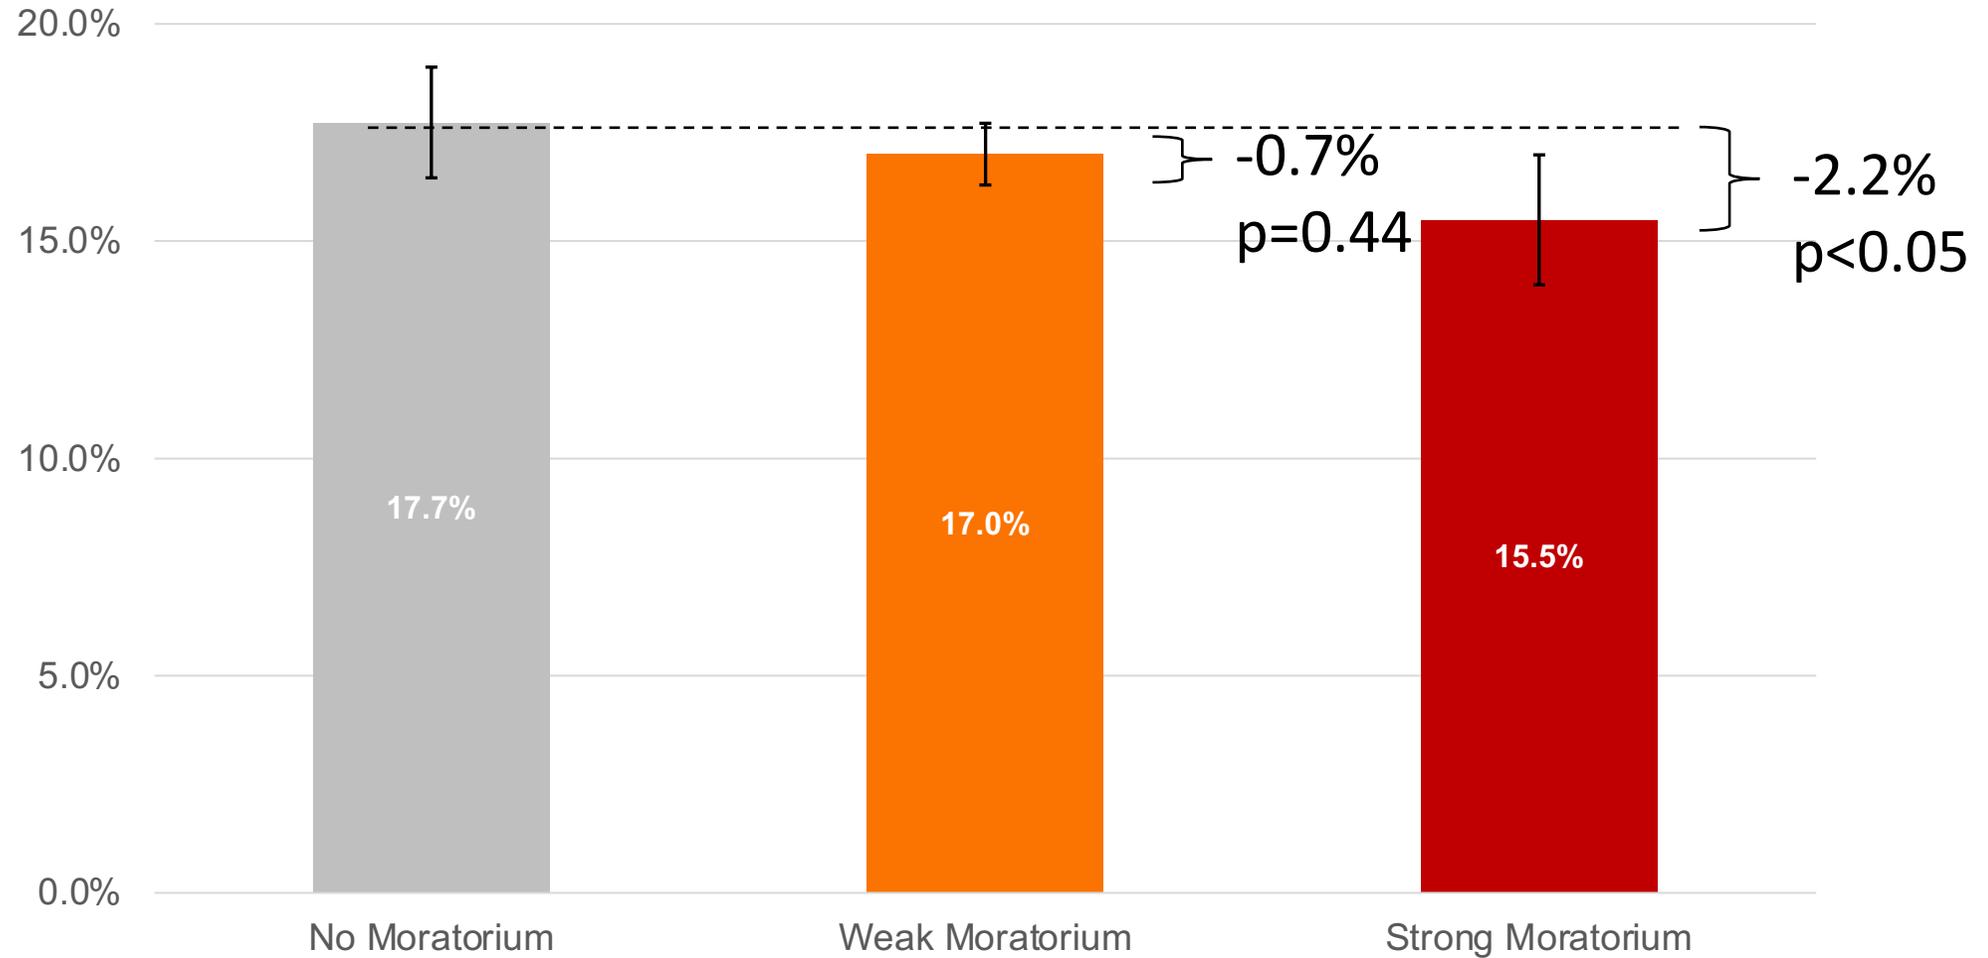

Fixed effects for time and individual

# Eviction protections over time

(2317 individuals, 9 observations each)

# Adjusted prevalence of mental distress

# Secondary analyses

Protective effects of strong moratoriums were most pronounced when

- Moratoriums were not restricted to COVID-19 financial hardship
- States had high rates of rental cost burden prior to COVID

# Conclusions

- Strong moratoriums reduced population mental distress; weak ones did not
  - Consistent with qualitative research
- Reductions were modest. This may be due to
  - Multiple, concurrent stressors
  - Limited awareness of protections among renters
  - Restricted scope of moratoriums

# Policy Implications

- Robust policies can help renters weather the pandemic
- CDC moratorium expires 6/30 (and under legal threat)
- State rollout of rent relief has been slow
  - Barring swift action, we may see a spike in eviction filings and mental distress

# Thinking beyond COVID...

- Further evidence that health harms wrought by evictions begin early in the process, with notice and filing
- Suggests a need for reforms to
  - Curtail filings (e.g. increased fees to landlords)
  - Expand tenant rights
  - Expand supply of affordable housing

# Thank you!
